

Welcome to The Trust Frontier

How many times did your AI tell you that you were wrong?

THE TRUST FRONTIER

MAY 19, 2026

How many times did your AI tell you that you were wrong? Now count how many times the people around you did.

A frontier is the edge of known territory. Trust is the currency that moves across that frontier. Beyond it, things are unmapped, no institutions, no accountability, no rules yet written. That is exactly where we are with AI right now. The decisions being made today about how much we rely on these systems will determine what comes after. We are not safely past this moment. We are still at the frontier. And the machine is not going to tell you. That is not what it was built for.

Why The Trust Frontier?

I am starting this publication because we are outsourcing our judgment faster than we can understand the consequences.

During my research at Princeton, I kept running into the same gap. The conversation about AI splits into two camps: blind optimism or existential fear. But there is a more urgent space in between. Not whether AI works, but what trusting it without friction is doing to us, to how we reason, defer, and decide. This publication looks at that through research, through behavior, and through the experience of living inside these systems while they are still being built.

The Trust Frontier is a chronicle of that transition. Not a tech news site. A compass for those who haven't yet noticed that 24/7 convenience comes with a cognitive debt we haven't started to count. The cost is never only money. It is always judgment.

Sitting Inside the Gap

I sit inside that gap. I am an undergraduate who studies the physics of information, how it moves, how it breaks, how trust within it is built or lost. Quantum computing taught me that a system can hold contradictory states simultaneously, and that the act of observing it changes what you find and I keep thinking about that when I watch people interact with AI. I am being trained inside these systems at the same moment they are being trained on us. That is not a coincidence. It is the reason I cannot look away.

What is Coming Next

We begin with the first of a four-part series:

The yes-man in the machine: why your AI is not the neutral expert you think it is. *The opening piece investigates why we have started to prefer the machine's affirmation over human expertise, and what that preference is costing us.*

The first piece is coming soon.

Ari

Algunas entregas aparecerán también en español.

(Some installments will also appear in Spanish.)
